

Best Practices for a successful IT project

for a successful IT project

The following "golden rules" might help to have a successful IT project:

Separation of concerns

Divide your problem into smaller (business oriented) modules, which can be easily adopted.

Security and data protection by design

When coming to planning and design phase, all aspects of security and data protection have to be included.

KISS

KISS stands for "Keep It Stupid Simple". Always use the simplest and most readable solution to solve your problem. Do not overengineer.

Use automation wherever possible

Automate all things as much as possible. Even if you think, it has to be done only twice or three times.
